AcreForge - Owner Quick Reference

Everything you need to run, share, fund and protect the app. Printed from your project files.

1. Where things are

Item	Location
Live site	https://jacobbaltins.github.io/acreforge/
Source repo (public)	https://github.com/jacobbaltins/acreforge
Pro waitlist	Button on the site opens a GitHub issue (posts are public)
Local project folder	C:\Users\mckam\.copilot\chats\2026-10-21\potential-garbanzo-2910df55
Saved project data	Your browser's localStorage (key oregon-estate-planner-v1). Not in the cloud.
Backup zip	acreforge.zip in the project folder
Legal guide	AcreForge-Ownership-and-Launch-Packet.pdf

2. How to use the app

About is the first screen. Use the sidebar for Site Designer, Buildings, Lot Builder, maps, dashboard and Settings.

Acreage: Settings lets you pick 5 to 1,000 acres. New projects default to 80. Importing a county/GIS KML or GeoJSON parcel sets the true acreage and checks placements.

Moving objects: click and drag in the Site Designer; positions snap to the grid (default 40 ft). At very large acreage objects look small but have an enlarged grab area. Use Fit plan to recenter.

Lot Builder: 12 library folders and presets (home, barn, shop, retail, full lot). Edit size, position, rotation and height.

State terrain map: USGS aerial imagery by default, Topo switch, optional OpenStreetMap context and 3D buildings at neighborhood zoom.

Reset: if the view is stuck, pick a smaller acreage in Settings or add ?edit=0 / clear site data in your browser.

Always: the app is conceptual planning only, not a survey or legal boundary.

3. Current status

Done	Not done yet
Live on GitHub Pages; free to host Pricing preview and waitlist link 80-acre default, 1,000 max Sidebar declutter; drag fix Legal packet, privacy and data notice pages README, CHANGELOG and zip current	Payments (Stripe) - not active Accounts and cloud saving Custom domain LLC and lawyer-reviewed terms Trademark clearance for the AcreForge name Testing DXF export and live 3D buildings in a real city Netlify is blocked by a credit limit; GitHub Pages is the host

4. Recommended order to make money

■ Buy a domain (about $20/yr, e.g. acreforge.com) and point it at GitHub Pages (Repo Settings > Pages > Custom domain).

■ Share the link in land, homestead and rural-property groups; count waitlist clicks as demand proof.

■ Run a small $50-100 ad or post test; watch how many people ask for Pro.

■ If demand is real: form an LLC, get lawyer-reviewed Terms and Privacy Policy.

■ Create a Stripe account and a Payment Link; send it to your assistant to wire into the Pro button (PAY_LINK in index.html).

■ Build accounts and cloud saving (Supabase + Stripe) so Pro has real value: saved projects, PDF export, parcel import.

■ Get a trademark search and attorney advice before heavy branding spend. Ask a patent attorney before spending on patents.

5. Suggested Pro pricing ideas (not active)

Plan	Idea	Status
Free	Full planner, saves in your browser	Live
Pro	Cloud saving, PDF/DXF export, parcel import helper; e.g. $8-15/month	Planned - waitlist only
Early Access	Discounted founder price for first users	Planned

6. Legal and safety checklist

■ Never say 'patented' or 'patent pending' unless a patent is actually filed.

■ Keep the disclaimer: conceptual planning only, not a survey or legal advice.

■ Credit map sources: USGS The National Map, AWS Terrain Tiles, OpenStreetMap contributors (ODbL), U.S. Census boundaries, MapLibre GL.

■ Do not collect payments or personal data until Terms, Privacy Policy and a payment processor are in place.

■ The GitHub repo is public: never commit passwords, API keys or customer data.

■ Waitlist issues are public posts; tell people not to include private info.

■ Public export removes parcel boundary, address, notes and finances before sharing a plan.

7. How to update the live site

1. Edit index.html in the project folder and test it locally.

2. Copy it into your clone of github.com/jacobbaltins/acreforge.

3. Run: git add -A, git commit -m "message", git push.

4. Wait about 1 minute, then hard refresh (Ctrl+F5) the live site.

8. Troubleshooting

Problem	Try this
Site shows an old version	Hard refresh with Ctrl+F5; wait 1-2 minutes after a deploy
Can't move objects	Reload the page; choose a smaller acreage; click directly on the object, not empty grid
Map is blank	Check internet; USGS and AWS tiles need a connection
Lost my project	It lives in this browser only; use the same browser/profile, or export before clearing data
Waitlist link fails	Needs a GitHub account to post an issue

Support the next steps: domain, Stripe link, accounts and cloud saving. Ask your assistant to start any of them.
